

LASER THERAPY

Photobiomodulation (PBM) therapy occurs when a dose of light energy reaches target tissue and results in decreased inflammation, decreased pain, and accelerated healing. It effectively treats a wide variety of conditions including pre-surgical, post-surgical, acute, and chronic disease states.

What will the application of laser therapy do for my pet?

Laser therapy applied with the Companion therapy laser system provides a sterile, pain-free, surgery-free, drug-free treatment which is used to treat a variety of injuries, wounds, fractures, neurological conditions, numerous dermatological problems, and pain. Whether your pet is rehabilitating from trauma or injury, healing from wounds, or simply aging, your companion will benefit from this revolutionary new approach to Veterinary medicine.

LASER THERAPY

HOW DOES IT WORK?

Companion Laser Therapy involves passing a Laser beam across your pet's skin, directly above the area where your pet has some discomfort.

To your pet it feels like some warmth is being dispensed to the exact spot where the tissue needs help.

During this time your pet feels extremely comfortable!

This invisible light beam is putting Laser energy into the cells and causing the cells to reproduce faster. This causes the cells to heal more quickly.

Laser therapy significantly reduces the pain at the site.
